

## **Press release**

### **LED combination rearlight for various DAF trucks**

Simple retrofit solution

We now offer a new full-LED combination rearlight. Professionals value the well-known outstanding product quality. The combination rearlight that is now available in the Elparts range features glowing-body technology in the tail and clearance lights. The use of double reflection prevents dazzling LED light and increases visual comfort. The combination rearlight connector offers high technical performance. The HDSCS (Heavy Duty Sealed Connectors System) is currently the safest truck and trailer connection technology on the market. It guarantees long-term reliability in heavy goods transport and also in the event of very high strain, such as strong vibrations, extreme temperatures, etc. The connection technology has been approved for the transport of hazardous goods and is therefore ADR/GGVS tested. Save money through partial replacement of the light: The outer lens can be simply replaced separately in the case of mechanical damage. Replacing both lights makes sense during a retrofit and this is taken into account in the price by parts specialists. The new full-LED combination rearlights (voltage 24 V) are suitable for the DAF model series LF, CF and XF. No additional LED control units are required for retrofitting the aforementioned vehicle series with LC8 combination rearlights.
